

RTM Analytics introduces the Alternative Commodity Algorithmic Program (ACAP), a next generation commodity index-like program that provides a more reasoned way to access the benefits available from the commodity asset class.

The index characteristics of ACAP include:

- Full transparency
- High liquidity
- Composed of US Exchange listed futures contracts (no counter-party risk)
- Fixed long/short/flat positioning methodology (no style drift) includes:
 - Trend algorithm
 - Seasonality factor
 - Volatility risk-parity weighting scheme
- Monthly position and rebalancing roll methodology
- Max allowable leverage 1.15. Historic average leverage .91
- Collateralized returns

Below are the hypothetical returns associated with the ACAP - Total Return (collateralized) program net of expected management fees and transaction costs.

ACAP compares favorably to other commodity programs and managed futures. More importantly, ACAP performance has been consistently non-correlated to equities and fixed income in all market environments, making ACAP a powerful diversification tool for inclusion in a well-structured portfolio. Investment managers primarily use commodities for diversification and have long been limited to various long-only

exposures. These allocations have suffered from diminished return expectations while increasingly becoming more correlated to equities, losing their effectiveness as a diversifier to a broad-based portfolio.

⁴ ACAP-S represents HYPOTHETICAL returns for the Alternative Commodity Algorithmic Program - Strategy

ACAP utilizes a proprietary seasonality algorithm that is a key input to the monthly positioning portion of the program. RTM Analytics personnel have been involved in commodities for over 40 years, and drawing on this experience allowed ACAP to intelligently incorporate seasonality factors into its methodology. An additional benefit of having seasonality factors as part of the program allows for a more equitable weighting scheme to be used. Many long-only commodity allocations, passive and active, suffer from underperformance in those very sectors where seasonality exists.

The following chart shows the CORN seasonality pattern that has historically been exhibited in the market since 1990. The data shown is derived using the December CORN futures price for each year from 1990 to 2023.

Traditional trend following methodologies would get long during the early rising price period in January and likely remain long through at least August (likely longer) depending on the length of the trend variable parameters. The suddenness of the trend reversal causes many trend following systems to suffer significant losses, often losing any profits made year-to-date and missing the trend reversal opportunity.

ACAP accounts for the historical seasonality associated with many commodities. This seasonality factor is not limited to just price but also volatility. The ACAP methodology takes both of these important variables into consideration when determining not only its monthly positioning, but also in assigning each component weight for the upcoming period.

The Alternative Commodity Algorithmic Program – Strategy (ACAP-S) is the hypothetical performance of ACAP accounting for estimated management, performance, and transaction fees. It is presented in the following tables to provide a more apples-to-apples comparison versus investable comparable ETF and mutual fund programs, all shown net of fees.

The Opportunity

- Passive long-only commodity allocations benchmarked to established commodity indices, such as the S&P Goldman Sachs Commodity Index (SPGSCI) and the Bloomberg Commodity Index (BCI), are estimated to be over \$250 billion.
- Alternative Commodity Algorithmic Program (VCAP), in our view, is comparable to investable commodity-based and managed futures programs.
- Managed Futures have over \$350 billion in assets¹.
- Current commodity-based ETFs have over \$126 billion in AUM, mostly in Gold related programs (\$110B)².
- Broad-based commodity-based ETFs have about \$16 billion in assets².

ACAP is competitive to all comparable investable commodity-based ETFs and mutual funds and thus can serve as a superior benchmark for both the passive and active commodity asset class. RTM Analytics is seeking to begin discussions with those who may be able to utilize ACAP in some capacity.

Alternative Commodity Algorithmic Program – Total Return (“ACAP”), and the Alternative Commodity Algorithmic Program Strategy (“ACAP-S”) shown in this presentation are HYPOTHETICAL returns.

PAST PERFORMANCE IS NO GUARANTEE OF FUTURE RESULTS

HYPOTHETICAL PERFORMANCE RESULTS HAVE MANY INHERENT LIMITATIONS, SOME OF WHICH ARE DESCRIBED BELOW.

ONE OF THE LIMITATIONS OF HYPOTHETICAL PERFORMANCE RESULTS IS THAT THEY ARE GENERALLY PREPARED WITH THE BENEFIT OF HINDSIGHT. IN ADDITION, HYPOTHETICAL TRADING DOES NOT INVOLVE FINANCIAL RISK, AND NO HYPOTHETICAL TRADING RECORD CAN COMPLETELY ACCOUNT FOR THE IMPACT OF FINANCIAL RISK IN ACTUAL TRADING. FOR EXAMPLE, THE ABILITY TO WITHSTAND LOSSES OR TO ADHERE TO A PARTICULAR TRADING PROGRAM IN SPITE OF TRADING LOSSES ARE MATERIAL POINTS WHICH CAN ALSO ADVERSELY AFFECT ACTUAL TRADING RESULTS. THERE ARE NUMEROUS OTHER FACTORS RELATED TO THE MARKET'S IN GENERAL OR TO THE IMPLEMENTATION OF ANY SPECIFIC TRADING PROGRAM WHICH CANNOT BE FULLY ACCOUNTED FOR IN THE PREPARATION OF HYPOTHETICAL PERFORMANCE RESULTS AND ALL OF WHICH CAN ADVERSELY AFFECT ACTUAL TRADING RESULTS.
